VAV TERMINAL APPLICATION KIT

Spend less time at each box.

Configure instead of recreating sequences. Balance without tying up the integrator. The VAV Terminal Application Kit helps teams reduce repeated work from setup to handover.

LIOB-585 VAV | LIOB-595 VAV

Let the balancer work independently.

Provide the TAB contractor with a separate BalanceTool project. When fitted and enabled, an L-STAT also supports balancing at the room, helping reduce integrator involvement.

Start with defaults

Predefined settings and automatic I/O allocation help reduce manual setup. Automatic L-STAT and MP-Bus detection simplifies device assignment.

Adapt in software

Move a point to another compatible channel to help resolve assignment errors without returning to physical wiring.

Hand over clearly

Generated wiring views, points information and sequence documentation give the service team a clearer record of the configured box.

Make the VAV Terminal Application part of your next project.
